The book begins with an introduction to sheep welfare in Part One, with chapters covering biology and natural behavior, sheep production systems, and consumer and societal expectations for sheep products. Part Two goes on to highlight new advances in sheep welfare assessment, before Part Three outlines a wide range of solutions to sheep welfare challenges. The final section looks ahead to the future, considering what sheep welfare will look like in 2030 and beyond. Essential reading for policy makers, researchers, and students, Advances in Sheep Welfare is a key reference tool for welfare research scientists and students, veterinarians involved in welfare assessment, and indeed anyone with a professional interest in the welfare of sheep. Brings together top researchers in the field to provide a comprehensive overview of recent advances in the understanding of sheep welfare and management.Presented part of a wider series, Advances in Agricultural Animal Welfare, which provides comprehensive coverage of animal welfare of the world's major farmed animals Highlights current advances and looks ahead to how sheep welfare management will develop in the next ten to fifteen years.Sheep Farming for Meat and Wool is based on research and extension projects conducted over many years by the Department of Primary Industries and its predecessors and the University of Melbourne. The book covers business management, pasture growth and management, nutrition and feed management, drought management, reproductive management, disease management, genetic improvement, animal welfare and working dog health. It also gives seasonal reminders for a spring lambing wool-producing flock, for autumn lambing Merino ewes joined to Border Leicester or Suffolk rams, and for winter lambing crossbred ewes joined to ten man sires. With its expert advice, tips, and practical guidance, this book will assist farmers and producers to improve their sheep production and help increase their flock numbers. Sheep Farming for Meat and Wool is an essential tool for farmers, students, and sheep producers. Sue Hides is a Veterinary Officer with the Victorian Department of Primary Industries. She has worked many years in the Gippsland region, in the delivery of animal health and welfare programs. John Webb Ware is a veterinarian and senior consultant with the University of Melbourne's Mackinnon Project. He has expertise in animal production systems and animal health. Jane Court is a Sheep Industry Officer with the Victorian Department of Primary Industries. Currently based in Seymour, she has also worked in East Gippsland, Central and North-East Victoria. She has worked on a range of trials including worm control, woolclip analysis, the Grasslands Productivity Program and Merino bloodline evaluation and is a past President of the Grassland Society of Southern Australia. This vintage guide to farming sheep contains information on every step of the process, from breeding and rearing to wool production and beyond. With detailed descriptions and clear explanations, "Sheep Production" is highly recommended for anyone with a practical interest in keeping sheep for pleasure or for profit. Contents include: "Sheep Farming", "Sheep Production", "Starting A Flock", "Selection And Management Of The Ram", "Management During Gestation Period", "Care At Lambing Time", "Care Of Ewe And Lambs After Lambing", "Management Of Sheep", "Sheep 'Feeding', "Suggested Rations", "Parasites And Ailments Of Sheep", etc. Many vintage books such as this are increasingly scarce and expensive. It is with this in mind that we are republishing this volume now in an affordable, modern, high-quality edition complete with a specially-commissioned new introduction on
Sheep farming. This early work on sheep production is both expensive and hard to find in its first edition. It contains information on breeding, care and management of sheep. This is a fascinating work and is thoroughly recommended for farmers. Many of the earliest books, particularly those dating back to the 1900s and before, are now extremely scarce. We are republishing these classic works in affordable, high quality, modern editions, using the original text and artwork. This book provides a review of the current state of knowledge on all aspects of sheep nutrition. The main emphasis is on sheep grazing in systems that range from intensively utilized small pastures to extensive rangelands. This book presents a compilation of the latest findings from reputable researchers around the globe, covering in detail climate change and its effects on sheep production. In the current global climate change scenario, information related to its impact on livestock agriculture is lacking. The negative impacts of climate change are already being felt by all livestock species. Further, the mitigation and amelioration strategies that are applicable for one species may not hold true for another. As such, concerted research efforts are needed to identify species-specific strategies for mitigation and adaptation. With that goal in mind, this book is the first of its kind to gather comprehensive information pertaining to the impact of climate change on various aspects of sheep production. It also sheds light on the role of sheep with regard to the global greenhouse gas pool. The book highlights the status quo of sheep production from climate change perspectives and projects the significance of adapting future sheep production to the challenges posed by climate change. It addresses in detail the various adaptations, methane mitigation and amelioration strategies needed to sustain sheep production in the future. In addition, the book presents development plans and policies that will allow the sheep industry to cope with current climate changes and strategies that will lessen future impacts. Bringing together essential information prepared by world-class researchers hailing from different countries, this book offers farmers and researchers the necessary tools to implement the latest adaptation and mitigation strategies for a sustainable global future. The Sheep and Goat Handbook includes presentations made at the International Stockmen's School, January 8-13, 1984. The faculty members of the School who authored this fourth volume of the Handbook, along with books on beef cattle, dairy cattle, and horses, are scholars, stockmen, and agribusiness leaders with national and international reputations. The papers are a mixture of technology and practice that present new concepts from the latest research results of experiments in all parts of the world. Relevant information and concepts from many related disciplines are included. Animal welfare is attracting increasing interest worldwide, but particularly from those in developed countries, who now have the knowledge and resources to be able to improve the welfare of farm animals. The increased attention given to animal welfare in the West derives largely from the relentless pursuit of financial reward and efficiency has led to the development of intensive animal production systems that disturb the conscience of many consumers. In developing countries, human survival is still a daily uncertainty, so that provision for animal welfare has to be balanced against human welfare. Welfare is usually provided for only if it supports the output of the animal, be it food, work, clothing, sport or companionship. In reality there are resources for all if they are properly husbanded in both developing and developed countries. The inequitable division of the world's riches creates physical and psychological poverty for animals and human alike in many sectors of the world. Livestock is the world's biggest land user (FAO, 2002) and the population is increasing rapidly to meet the need of an expanding human population. Populations of farm animals managed by humans are therefore increasing worldwide, and in some regions there is a tendency to allocate fewer resources, such as labour, to each animal with potentially adverse consequences for the animals' welfare. Goat science covers a wide range and variety of topics, from genetics and breeding, via nutrition, production systems, reproduction, milk and meat production, animal health and parasitism, etc., up to the effects of goat products on human health. In this book, several parts of them are presented within 18 different chapters. Molecular genetics and genetic improvement of goats are the new approaches of goat development. Several factors affect the passage rate of digesta in goats, but for diet properties, goats are similar to other ruminants, efficiency in growth is high and the dangerous ones in other species are absent. Milk and meat traits of goats are almost equally important and have significant positive impacts on human health. Many factors affect the health of goats, heat stress being of increasing importance. Production systems could modify all of the abovementioned characteristics of goats. Very Good, No Highlights or Markup, all pages are intact. Sheep Flock Health: a planned approach is a practical guide to the diagnosis and management of production limiting diseases in sheep. The problem-based approach helps both farmers and veterinary practitioners identify health problems. The focus is on good management practices to prevent disease in the first place and to optimise production. Focuses on the achievement and maintenance of optimal productivity, rather than on a catalogue of individual diseases of sheep. Written by an expert with a strong international reputation. Suitable not only for veterinarians and veterinary students, but also progressive sheep farmers. A comprehensive guide to Australian wool growing, published in 2006 and now out of print. This book covers choices of wool-growing enterprises, identifying, customer needs, assessing profitability, establishing breeding objectives, selection and culling, joining management, nutrition, pastures and grazing management, flock health, preparation and sale of the wool clip. Table of Contents: Chapter 1. The Australian wool industry Chapter 2. Enterprise choice Chapter 3. Who are your customers? Chapter 4. Can Merino wool be profitable? Chapter 5. Establish your breeding objective Chapter 6. Choosing a ram source Chapter 7. Selection and culling Chapter 8. Ram and ewe management Chapter 9. Joining management Chapter 10. Nutrition requirements and digestion Chapter 11. Wool production from pasture Chapter 12. Grazing management Chapter 13. Flock health Chapter 14. Preparing and selling your wool clip Chapter 15. How much is your wool worth? Appendices: 1. Gross margin templates 2. Glossary of wool processing terms 3. Cost of production template 4. Individual animal management 5. Liveweight and body condition assessment 6. Pasture assessment 7. Fodder budgeting calculation template 8. Predicted daily intake of pasture by ewes 9. Some sheep diseases and their prevention 10. Merino wool clip worksheet 11. Shearing data and clip analysis templates References Further Reading. Organic farming is a progressive method of farming and food production it does not mean going back to traditional (old) methods of farming. Many of the traditional farming methods used in the past are still useful today. Organic farming takes the best of these and combines them with modern scientific knowledge. Authors’ task was to write a book where many different existing studies could be presented in a single volume, making it easy for the reader to compare methods, results and conclusions. As a result, studies from different countries have been compiled into one book. I believe that the opportunity to compare results and conclusions from different authors will create a new perspective in organic farming and food production. I hope that our book will help researchers and students from all over the world to attain new and interesting results in the field of organic farming and food production. A comprehensive handbook on sheep breeding, production systems and marketing. The book emphasises that a planned approach to sheep production is a necessary prerequisite for profitable production. The book draws heavily on the latest information from the Meat and Livestock Commission, whose purpose is improving the efficiency of production and quality of meat. A major part of the book concentrates on the factors which contribute to economic production - ewe output, lamb returns including carcass quality, grassland management, breeding for characters of economic importance, ewe and ram replacement policies, feeding, planned flock health and production systems. Sheep Farming for Meat and Wool contains practical, up-to-date information on sheep production and management for producers throughout temperate Australia. It is based on research and extension and management of sheep.
projects conducted over many years by the Department of Primary Industries and its predecessors and the University of Melbourne. The book covers business management, pasture growth and management, nutrition and feed management, drought management, reproductive management, disease management, genetic improvement, animal welfare and working dog health. It also gives seasonal reminders for a spring lambing wool-producing flock, for autumn lambing Merino ewes joined to Border Leicester rams, and for winter lambing crossbred ewes joined to terminal sires. It will guide new and established farmers, students of agriculture and service providers with detailed information on the why and how of sheep production, and will assist farmer groups to initiate activities aimed at increasing their efficiency in specific areas of sheep production.
